

RADON IN YOUR HOUSEHOLD WELL WATER

Radon is a naturally occurring, radioactive gas, which originates from uranium and radium found in underground geologic deposits. When released underground, radon may move toward the surface in air or groundwater.

- Radon is colorless, odorless, and tasteless. **Exposure to Radon gas most commonly occurs through elevated levels in home air**
- However, in Georgia (and the neighboring states of South and North Carolina) there is a risk of exposure to **Radon** dissolved in drinking water.

For testing and fixing (if needed) **Radon** in your household well water, visit:
